Captain Rollout & Training

Why are we doing this?

The Look-alike Problem

- When two similar products are on the same shelf, pickers scan the wrong one.
- The scanner rejects it, but it looks like a barcode glitch. The picker overrides it.
- The wrong item ships. We find out days later when a customer complains.

Goal: Catch the pattern before the customer does.

How the system helps

We are not watching individual pickers.

We are looking at the shelf. If multiple pickers scan the same wrong product at the same location, it's a shelf problem.

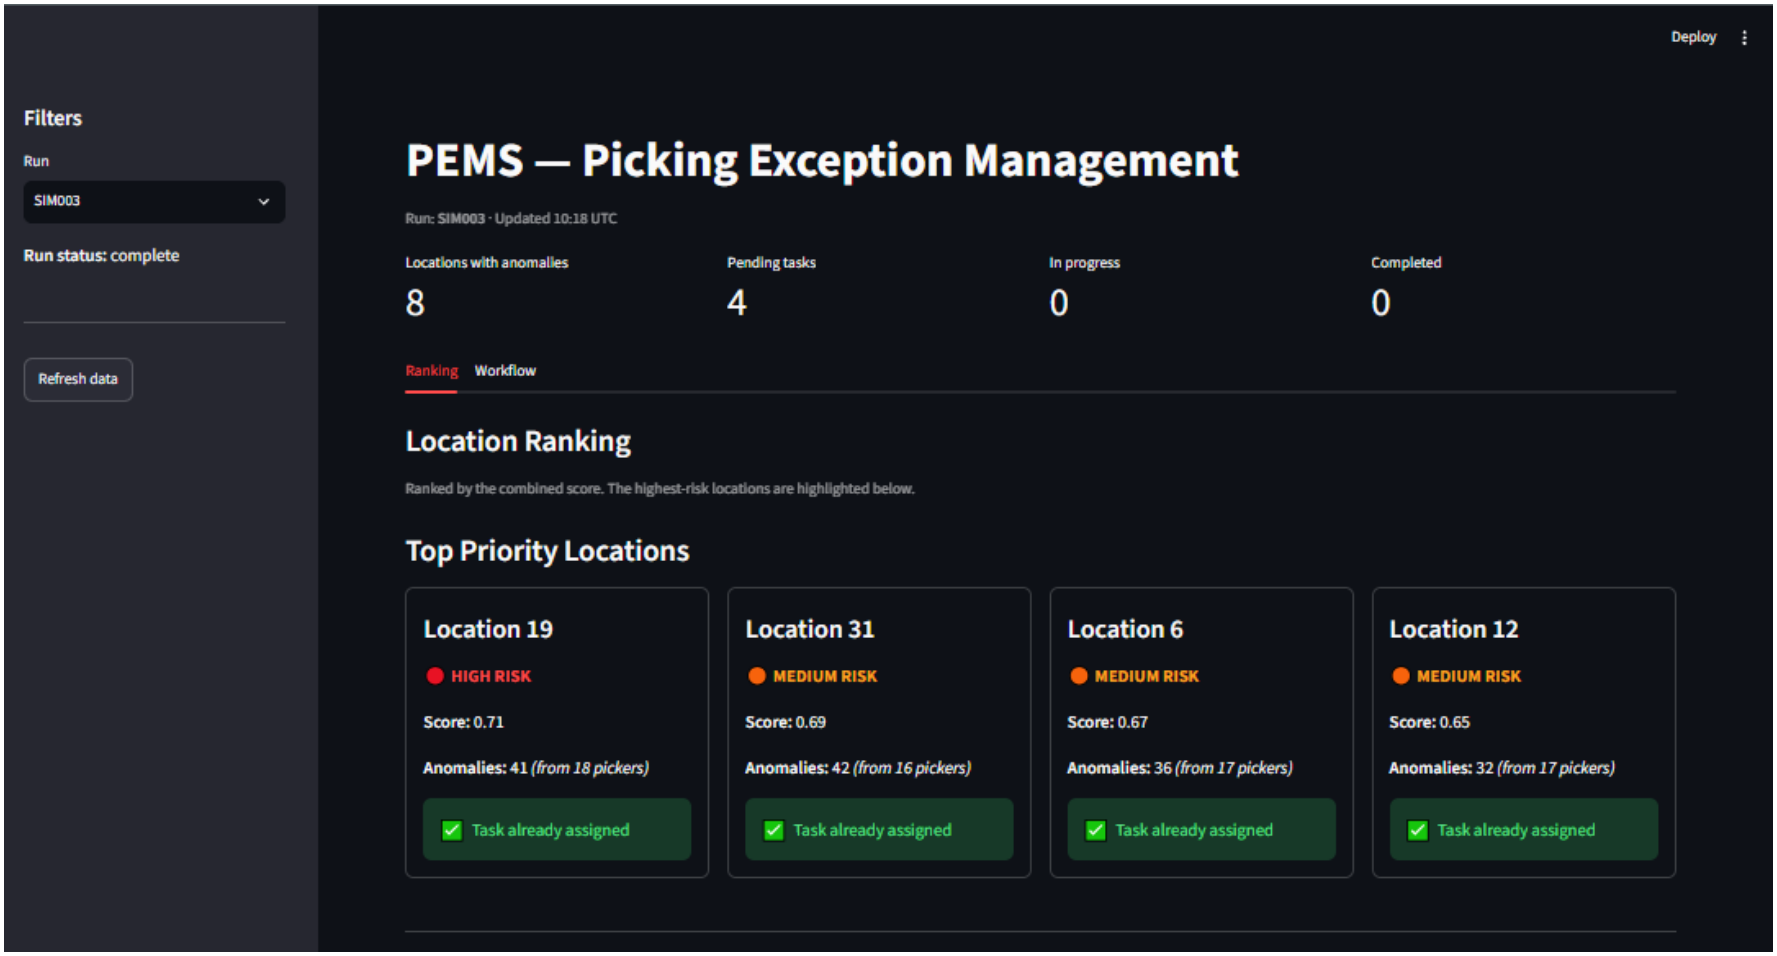

Every morning, the system generates a Dispatch Sheet.

It ranks locations by Risk Score, based on:

1. Frequency
2. Diversity
3. Consistency
4. Recency

The Captain Dashboard

This is your view. Open the browser, check the ranking, and see the evidence.

Your Daily Workflow

Review the suggested tasks.

1. **Accept the ones that look right. Reject duplicates or known issues.**
2. **Assign a Quality Shopper.**
3. **Shopper visits, records the cause, and closes the loop.**

The system learns from the shopper's feedback.

System Status & Impact

Current Status (Run SIM003):

- Top flagged location: 19
- 41 mismatch events detected

This week, we have a clear list of where to send shoppers first.

Open the Excel dispatch sheet to manage your shift.
